

DockIQ connects frontline exception handling with supervisor control in one operating workflow

Three capability groups turn dock-door observations into guided actions, prioritized decisions, and an auditable record.

1

Worker operations

CONTEXT AT POINT OF WORK

Assigned dock and order context

Trailer, customer, carrier, BOL, products, and expected quantities remain visible.

Trailer inspection workflow

Seal, cleanliness, visible damage, and temperature checks gate completion.

Guided loading and unloading

Product counts, load patterns, SOP rules, and discrepancy handling support each task.

Mobile-first quick requests

Operators request equipment, supplies, or floor support from the active dock.

BENEFIT

Less context switching and fewer incomplete handoffs

2

Exception intelligence

CONSISTENT RESPONSE UNDER PRESSURE

Transparent severity scoring

Issue type, product risk, customer tier, temperature delta, and count variance explain priority.

Grounded SOP retrieval

Step-by-step guidance includes confidence and source references from the local knowledge base.

Live-or-fallback AI

Optional live assistance enhances chat; deterministic guidance preserves the core workflow.

Controlled resolution paths

Critical issues require supervisor action; invalid and contradictory transitions are rejected.

BENEFIT

Faster, safer decisions with explainable guidance

3

Supervisor control

PRIORITY AND VISIBILITY

Priority issue queue

Open work is organized by severity, age, dock, and estimated operational impact.

Realtime floor updates

WebSocket events refresh issue, request, broadcast, and order activity.

Resolution and audit trail

Supervisor actions, notes, source guidance, and timestamps remain searchable.

Analytics and shift handoff

Synthetic operational views summarize patterns and preserve context across shifts.

BENEFIT

Attention moves to the highest-risk work first

The demo proves a complete control loop while keeping production claims explicit and defensible

DockIQ improves the quality and speed of exception handling without depending on live AI or unsupported warehouse integrations.

OPERATIONAL BENEFITS

Clarity	Each role sees the next required action Assignment context, completion gates, and status feedback reduce ambiguity at the dock.
Risk control	Unsafe completion paths are blocked Open critical issues, failed inspections, missing counts, and invalid roles stop workflow completion.
Response	Relevant guidance arrives with the issue Severity reasoning and cited procedures travel from worker report to supervisor decision.
Continuity	The operating record survives provider failure Deterministic fallback, persistent events, analytics, and handoffs keep the demo usable.

Bottom line: DockIQ demonstrates guided detection, grounded resolution, prioritized supervision, and traceable closure as one connected workflow.

WHAT THE SHOWCASE DEMONSTRATES

- 01

Temperature exception detected
A worker selects the measured product and compares 28 F against a 0 F maximum.
- 02

Critical guidance grounded
Cold Chain SOP 2.3 is returned with confidence, source, and action steps.
- 03

Supervisor decision prioritized
The escalated issue carries dock, operator, product, carrier, cost context, and notes.
- 04

Resolution recorded
Validated state transitions update the issue, dock status, searchable logs, and analytics.
